Round 1 RIPMWC open

2010 RIPMWC open round 1

1.

Using only brackets, +, −, ×, ÷, we can form the number 400 from multiple 4's as follows:

$$(4 \times 4 \times 4 + 4 \times (4 + 4) + 4) \times 4$$

or

$$(4 \times 4 + 4) \times (4 \times 4 + 4)$$

Again using only brackets, +, −, ×, ÷, What is the minimum number of 10's required to form the number 2010?

2.

Each time the two hands of a standard 12-hour clock form a straight line, a bell chimes once. From 01 00 on a certain day to 01 00 the next day, how many chimes will be heard?

3.

How many pairs of positive integers (m, n) satisfy the equation $mn = 2010$?

4.

The sum of digits of 2010 is $2 + 0 + 1 + 0 = 3$. The next number after 2010 that has the same sum of digits as 3 is 2100. Let a, b, c be the next 3 numbers after 2100 that has the same sum of digits as 3. What is the value of $a + b + c$?

7.

Suppose you are writing odd positive integers in a row, without blank spaces, as shown below

13579111315. . .

What will be the 1000th digit?

8.

Four pupils Aaron, Bob, Charles and Dean took a mathematics examination in which each of their answer is either correct or wrong. Aaron got correct half of the total questions plus 7 questions, Bob got correct one third of the total questions plus 17 questions, Charles got correct one fourth of the total questions plus 22 questions and Dean got correct one fifth of the total questions plus 25 questions. There are between 1 and 100 questions in the examination. Which pupil got the most questions correct?

17.

There are 8 consecutive traffic lights along a straight road. Each light remains green for 1.5 minutes, yellow for 4 seconds and red for 1.5 minutes. The lights are synchronised so that each light turns red 10 seconds after the preceding one turns red. What is the longest interval of time, in seconds, during which all the 8 lights are green?

20.

A car travels from town X to town Y along a highway. An hour after starting, it meets with an accident and is detained by the traffic police for half an hour, after which it proceeds at $\frac{3}{4}$ of its former speed and arrives $3\frac{1}{2}$ hours late. Had the accident happened 90 km farther along the highway, it would have arrived 3 hours late. Find the distance between town X and town Y in km.
